W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such as :

New soluble fragments of glutamic acid decarboxylase protein - used for the diagnosis and treatment of insulin dependent diabetes mellitus and stiff man syndrome.

Disclosure; Fig. 1; 73pp; Anglish.
The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59518) were determined. New soluble fragments of GAD65 (R59518-5) were prepared by deletion/substitution mutagenesis. These fragments are free of N-terminal amino acids that limit solubility. Different fragments contain epitopes for different classes of GAD65 autoantibodies.

Sequence 540 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   GAD65 1-45 N-terminal-deleted mutant. GAD65; glutamate-decarboxylase; diabetes mellitus; stiff man syndrome; autoantibody; mutagenesis.

                                      New soluble fragments of glutamic acid decarboxylase protein used for the diagnosis and treatment of insulin dependent diabetes mellitus and stiff man syndrome.

Disclosure: Fig. 1: 73pp: English.

The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59517) were determined. New soluble fragments of GAD65 (R59518-25) were prepared by deletion/substitution mutagenesis. These fragments are free of N-terminal amino acids that limit solubility. Different fragments contain epitopes for different classes of GAD65 autoantibodies.
                                                                                                                                                                                                                                                                                                               GAD65 1-31 deleted, C45A mutant.

This represents a human GAD55 protein sequence. The invention provides soluble fragments of GAD65 that are specifically reactive with at least one class of GAD65 autoantibody. The fragments are substantially free of N-terminal amino acids that would otherwise limit solubility. Different fragments contain different epitopes for different classes of GAD65 autoantibodies. These fragments are used in the methods of the invention for detection of GAD65 autoantibodies. These fragments are used for monitoring insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LT 8

The invention relates to soluble fragments of a GAD65 protein that are specifically reactive with a GAD65 autoantibody (AAb), where the fragment is at least 99% pure and the AAb binds to a conformational epitope of the fragment. The soluble GAD65 fragments can be used to distinguish between insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome. They can also be used for diabetes mellitus (IDDM) and stiff man syndrome. The fragments can distinguish different temporal and stiff man syndrome. The fragments can distinguish different temporal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide fragments of glutamic acid decarboxylase - for diagnosis and treatment of auto:immune disease, esp. insulin dependent diabetes, also related nucleic acid, vectors, antibodies, hybridoma(s) etc.

Example 1; Fig 3; 100pp; English.

086481 and 086482 encode R71733 and R79105, rat and human glut acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72261-R7298 were derived. These fragment disease to detect autoantibodies against GAD, e.g. to diag and treat GAD-related autoimmune disorders, such as insulin dependent diabetes mellitus or stiff man disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24-AUG-1994; U09478.

Polynucleotide encoding human islet glutamic acid decarboxylase - polynucleotide encoding human islet glutamic acid decarboxylase - used to test for auto-antibodies against itself to diagnose insulin dependent diabetes mellitus pisclosure; Fig 2; 45pp; English.

The sequence is that of human pancreatic islet glutamic acid decarboxylase (GAD) which is used to test biological samples for the presence of autoantibodies to human GAD. It can also be used to remove antibodies against GAD from plasma in order to treat an autoimmune response to GAD, e.g. in insulin-dependent diabetes melting (IDDM), and may also be used to induce immunological tolerance to GAD by giving GAD that specifically binds the GAD receptor on immature T
                                                                                                                                                                                                                                                                                                                                 partial peptide(s) - for diagnosing diseases associated with auto:Immune reaction
Claim 8; Page 14-16; 32pp; Japanese.
A composition has been developed for diagnosing diseases associated with autoimmune reaction caused by 65K-glutamic acid decarboxylase (GAD65) or its partial peptides. The composition reacts with T cells in and/or on the surface of mammalian skin to cause inflammation. The present sequence represents human GAD65. GAD65 and its partial peptides are used to diagnose diseases associated with autoimmune

New Soluble fragments of glutamic acid decarboxylase protein - used for the diagnosis and treatment of insulin dependent diabetes mellitus and stiff man syndrome.

T used for the diagnosis and treatment of of insulin dependent diabetes mellitus and stiff man syndrome.

T classes it is 73pp; English.

Disclosure; Fig. 1; 73pp; English.

C The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59517) were determined. New soluble fragments of GAD65 (R59518-25) were prepared by deletion/substitution mutagenesis. These fragments are free of N-terminal amino acids that limit solubility. Different fragments contain epitopes for GAD65 autoantibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT Glutamic acid decarboxylase isolated polypeptide(s) - useful for daynosis and treatment of auto-immune diseases, e.g. insulin dependent diabetes mellitus, drug screening and antibody prodn. PS Disclosure; Fig 3; 35pp; English.

The DNA encoding glutamic acid decarboxylase (GAD 65) was obtd. by standard recombinant DNA techniques. The protein, or fragments of it, may be used for the detection of autoantibodies to GAD 65. It can also be used for screening drugs such as those that alter GAD 65. Such methods can be used in the diagnosis and therapy of autoimmune diseases such as insulin dependent diabetes mellitus and "stiff man" syndrome. The protein can be used to rblock the continuance of an autoimmune response to GAD 65.

It may also be coupled to therapeutic agents and used immunothera-sec and sec also R29625-8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Loc

PT New human glutamic acid decarboxylase peptide(s) - used for process.

PT treatment, diagnosis and determining predisposition to diabetes and process.

PS Disclosure, Fig 1; 28pp; English.

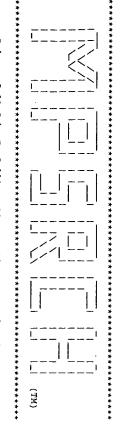

CC This sequence represents the 65 kD isoform of human glutamic acid concerns ylase (GAD65). GAD is an enzyme expressed in the beta cells of the pancreas, and in neurons of the central nervous system. There are two isoforms of GAD, a 67 kD isoform, and GAD65. Immunodominant regions of CC GAD65, and analogues of the fragments, are used in the methods of the cinvention. The methods are for detecting or treating diabetes or a cc predisposition to diabetes. The peptides can also be used for native peptides with selective changes of crucial residues can induce curresponsiveness or change the responsiveness of antigen-specific autoreactive T cells. The peptide analogues compete for binding to MHC can do not cause proliferation of the crucial residues can active peptide-specific T cells.

Run on: MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Tue Mar 7 21:16:05 2000; MasPar time 5.48 Seconds 172.132 Million cell updates/sec

Scoring table: Sequence: Description: Perfect Score: PAM 150 Gap 15 >US-08-981-824-2 (1-20) from US08981824.pep 159 1 SNMYAMMIARFKMFPEVKEK 20

Searched: 142080 seqs, 47172406 residues

Statistics: Databas Post-processing: _Mean_30-041; Variance 49.478; scale 0.607 pir62 1:pir1 2:pir2 3:pir3 4:pir4 Minthum Match 0% Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GAE also been implicated as an autoantigen in autoimmune disease stiff-man syndrome and insulin-dependent diabetes mellitus.
                                                                                                                                                                                                                                                  This enzyme catalyzes the conversion of glutamic acid into gamma-amino butyric acid.

NT This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.
IFICATION #superfamily human glutamate decarboxylase
carbon-carbon lyase; carboxy-lyase; phosphoprotein; pyridoxal
                                                                                                                                                                                            ##residues 1-594 ##label KOB 1-59163858; PIDN:AAA51430.1;

##note this sequence has been revised in reference A46758

COMMENT This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                      CLASSIFICATION SUMMARY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT

GAD has also been implicated as an autoantigen in autoimmune disease stiff-man syndrome and insulin-dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                             70.4%;

Statistics: Mean 30.741; Variance 44.172; scale 0.696

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

IN VISUAL SAND OLFACTORY SENSORY TRANSDUCTION.

TISSUE SPECIFICITY: IN PRE- AND POSTMEIOTIC MALE GERM CELLS IN TRESTIS. IN PHOTORECEPTOR CELLS OF THE REFINA AND IN THE OLFACTORY RECEPTORS, AND IN CERTAIN EPITHELIA OF THE RESPIRATORY TRACT AND CHOROID PLEXUS (BRAIN).

DEVELOPMENTAL STAGE: ON DAY 14 OR 17 OF EMBRYONIC DEVELOPMENT.

SIMILARITY: BELONGS TO THE CDC2/CDC28 SUBFAMILY OF SER/THR PROTEIN KINASES. BELONGS TO THE CDC2/CDXX SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SITE
